"Music Player playing 'Might As Well Dance'-Jason Mraz" - Apple Music

Searching Music - Spotify

Overview:
   An Android app that allows users to play songs through a simple music player, while also allowing music to be searched and played on the fly. It essentially bypasses ads (for now, since no revenue is intended yet), while also offering an extended library beyond what Spotify offers. This is especially the case for international artists, in which some regional songs may not be offered on Spotify.

Features:
   Functional:
      -Song Search
      -Splash screen (during loading)
      -Configuration/Settings Screen
      -Profile Overview Screen
      -Main Page Screen
      -Music Player UI

   Non-functional:
      -Limit song access through Youtube
      -Written in Java/C++ (possibly HTML/CSS for formatting)
      -Must have access to the Internet

   Requirements:
      -Must run on Android
      -Developed on Android Studio (for the most part)

Bonus features/Stretch goals:
   -Song stats (Songs listened frequently to, genres frequently listened, etc.)
   -Regional playlists - based on where you are, a playlist/artist list will be offered
   -Dark Mode/Light Mode (Default)

Division of Labor (Just with what we're interested with right now):
   -Wilson: Main Page Screen, Configuration/Settings Screen, Music Player UI
   -Jordan: Splash Screen, Song Search, Regional playlists
   -Michael: Song Search, Song Stats
   -Stephen: Profile Overview, Main Page Screen, Configuration/Settings Screen
